

# MADREPORIFORM

*Meaning: Madreporiform refers to a porous, sieve-like structure in echinoderms, such as sea stars, that facilitates the intake of water into their water vascular system.*

1. The madreporiform structure in sea stars plays a crucial role in their water vascular system.
2. Researchers discovered a unique madreporiform organ in a newly identified species of echinoderm.
3. The madreporiform plate serves as the entry point for water in many marine invertebrates.
4. Understanding the function of the madreporiform in various species can shed light on their evolutionary adaptations.
5. In marine biology, the madreporiform is often studied for its role in locomotion and feeding mechanisms.
