

MANGROVE

Meaning: Mangrove: a type of coastal ecosystem characterized by salt-tolerant trees that thrive in intertidal zones, providing habitat and protection for diverse wildlife and coastal areas.

1. Mangroves are vital ecosystems that protect coastlines from erosion.
2. The rich biodiversity found in mangrove forests supports numerous species of wildlife.
3. Many coastal communities rely on mangroves for fishing and tourism opportunities.
4. Restoration efforts aim to revive mangrove habitats that have been damaged by pollution.
5. Researchers study mangroves to understand their role in carbon sequestration and climate change mitigation.
