

MESOPODIAL

Meaning: Mesopodial refers to the bones or structures located in the middle segment of the limbs of vertebrates, particularly in relation to amphibians and reptiles.

1. The mesopodial bones play a crucial role in the locomotion of various amphibian species.
2. Researchers have identified mesopodial structures that provide support for the limbs of ancient reptiles.
3. In the study of comparative anatomy, mesopodial elements are often analyzed to understand evolutionary adaptations.
4. The mesopodial region of the limb is critical for the stability and agility of certain aquatic animals.
5. Morphological variations in mesopodial traits can indicate the ecological niches occupied by different species.
