

MONOPHYDONT

Meaning: Monophyodont refers to species that develop only one set of teeth during their lifetime.

1. The monophyodont nature of certain species means they only develop a single set of teeth throughout their lifetime.
2. In contrast to polyphyodonts, monophyodonts rely on the durability of their single set of teeth for survival.
3. Sharks and some mammals exhibit fascinating adaptations, but only a few are classified as monophyodont.
4. The evolutionary advantages of being monophyodont in specific environments can be quite significant.
5. Scientists study monophyodont species to better understand dental evolution and its implications for overall health.
