

MYELOID

Meaning: Myeloid refers to cells or tissues derived from the bone marrow that are involved in the formation of blood cells, particularly related to the immune system.

1. Myeloid cells play a crucial role in the immune response by differentiating into various types of blood cells.
2. The presence of myeloid lineage cells can indicate certain types of blood disorders.
3. Researchers are studying myeloid-derived suppressor cells to understand their impact on cancer progression.
4. In patients with leukemia, myeloid blast cells can dominate the bone marrow, disrupting normal blood cell production.
5. The myeloid compartment of the immune system is essential for combating bacterial infections.
