

NONVASCULAR

Meaning: Nonvascular refers to organisms, particularly plants, that lack specialized vascular tissue for the transport of water and nutrients, typically resulting in smaller sizes and a preference for moist habitats.

1. Nonvascular plants, such as mosses and liverworts, thrive in damp environments.
2. The absence of vascular tissue in nonvascular organisms limits their height and size.
3. Researchers found that nonvascular species play a crucial role in soil formation and nutrient cycling.
4. In biology class, we learned that nonvascular plants reproduce using spores instead of seeds.
5. The study of nonvascular organisms is essential for understanding early plant evolution.
