

NYCTITROPISM

Meaning: Nyctitropism is the movement or behavior of certain plants, particularly flowers, that respond to the onset of darkness by closing or repositioning their leaves or petals.

1. The phenomenon of nyctitropism can be observed in certain flowers that close at night.
2. Researchers studied the effects of light exposure on plants exhibiting nyctitropism.
3. Nyctitropism is crucial for plants to conserve energy and protect themselves from nighttime predators.
4. Understanding nyctitropism can help horticulturists optimize growing conditions for various species.
5. The delicate balance of nyctitropism and phototropism in plants reveals their complex adaptive strategies.
