

OPERAND

Meaning: Operand: A quantity or variable on which an operation is performed in mathematics or programming.

1. The operand in the mathematical expression determines the result of the operation.
2. In programming, an operand can be a variable, constant, or even a more complex expression.
3. Understanding how operators interact with operands is crucial for effective coding.
4. The function requires two operands to perform addition and return the final value.
5. In logic, operands are essential for constructing meaningful propositions and evaluating their truth values.
