

OPHORECTOMY

Meaning: Oophorectomy is a surgical procedure that involves the removal of one or both ovaries.

1. Oophorectomy is often performed as a preventive measure in women at high risk for ovarian cancer.
2. The recovery process after an oophorectomy can vary depending on the patient's overall health and the type of surgery performed.
3. After her oophorectomy, she experienced significant hormonal changes that required medical management.
4. Many doctors recommend discussing the potential long-term effects of oophorectomy with patients before the procedure.
5. Oophorectomy can lead to early menopause, affecting both physical health and emotional well-being.
