

OVERFLUX

Meaning: Overflux refers to an excessive or abnormal flow or transfer of a substance, particularly in a system, such as a reactor's cooling system.

1. The engineers conducted extensive tests to measure the overflux in the reactor's cooling system.
2. After analyzing the data, they discovered that the overflux levels were higher than anticipated during peak operation.
3. To prevent damage, the team implemented a new protocol to monitor and control the overflux in real-time.
4. The unexpected overflux in the system raised concerns about the overall efficiency of the energy production process.
5. In response to the overflux issue, the developers redesigned the circuit to enhance stability and performance.
