

PARSER

Meaning: A parser is a software component that analyzes and interprets input data or source code to produce a structured output.

1. The parser analyzes the input data to generate a structured output.
2. In programming language design, a parser is essential for interpreting source code.
3. A robust parser can identify syntax errors before the code is executed.
4. Developers often use a parser to transform raw text into a more usable format.
5. By utilizing a parser, the application can process complex data files efficiently.
