

PAWL

Meaning: A pawl is a pivoted lever or catch that engages with a ratchet to allow movement in one direction while preventing reverse motion, commonly used in mechanical devices like clocks.

1. The old clock mechanism relied on a finely crafted pawl to regulate its movement.
2. During the repair, he discovered that the pawl had worn down and needed replacement.
3. The design of the locking system included a pawl that would securely hold the door in place.
4. As the pawl engaged with the ratchet, the machine smoothly advanced to the next position.
5. Understanding the function of the pawl was crucial for anyone attempting to fix the antique machinery.
6. The pawl mechanism in the clock prevents the gears from unwinding too quickly.
7. He carefully inspected the pawl to ensure it was functioning properly within the assembly.
8. During the repair, she noticed that the pawl had worn down and needed to be replaced.
9. The design of the device included a pawl that engages with a ratchet to lock it in place.
10. As the machine revolved, the pawl clicked into position, securing the next step in the process.
