

PERFUSION

Meaning: Perfusion is the process of supplying blood to an organ or tissue, ensuring adequate oxygen and nutrient delivery.

1. Perfusion of the heart is critical during cardiac surgery to ensure adequate blood flow to the tissue.
2. The researchers measured the perfusion rate of the brain during different states of activity.
3. Improving tissue perfusion can significantly enhance recovery in patients with chronic wounds.
4. Inadequate perfusion can lead to severe complications, including organ failure and tissue necrosis.
5. The new drug showed promising results in increasing blood perfusion in patients with peripheral artery disease.
