

PHLYCTENULAR

Meaning: Phlyctenular refers to a type of inflammation of the eye, particularly involving the conjunctiva, characterized by the formation of small, raised lesions, often associated with infections such as tuberculosis.

1. Phlyctenular keratoconjunctivitis is characterized by the presence of a small, raised lesion on the conjunctiva.
2. The patient's symptoms were consistent with a phlyctenular reaction, often triggered by a tuberculosis infection.
3. In some cases, phlyctenular lesions can cause significant discomfort and visual disturbances.
4. Treatment for phlyctenular disease typically involves addressing the underlying infectious cause and reducing inflammation.
5. Ophthalmologists often see phlyctenular changes in patients with a history of exposure to specific pathogens.
