

PHOTOPSIA

Meaning: Photopsia is the perception of flashes of light or visual disturbances that occur without an external light source.

1. Photopsia can be a disconcerting experience, as it often involves seeing flashes of light that are not actually present.
2. Many patients report experiencing photopsia during migraines, leading to visual disturbances that can be quite alarming.
3. Understanding the causes of photopsia is essential for effective diagnosis and treatment in ophthalmology.
4. In some cases, photopsia may indicate underlying retinal issues, making it important to seek medical advice if it occurs suddenly.
5. The phenomenon of photopsia can also be linked to various neurological conditions, highlighting the complexity of visual perception.
