

PLAGIOCLASE

Meaning: Plagioclase is a series of tectosilicate minerals that are a significant component of igneous and metamorphic rocks, characterized by a varying composition of sodium and calcium feldspar.

1. Plagioclase is a common mineral found in many igneous and metamorphic rocks.
2. The geologist identified the plagioclase crystals in the thin section under the microscope.
3. During the field trip, we collected samples that contained both quartz and plagioclase.
4. Plagioclase feldspar is known for its twinning and varying composition between sodium and calcium.
5. In the granite formation, plagioclase played a crucial role in the rock's overall texture and appearance.
