

POLYACID

Meaning: Polyacid is a type of polymer that contains multiple acidic functional groups, often used in applications such as dental materials and polymer composites for its adhesive and stabilizing properties.

1. Polyacid is often used in the formulation of dental materials due to its adhesive properties.
2. The research team discovered a new polyacid that enhances the stability of polymer composites.
3. In chemistry, polyacids can donate multiple protons in a reaction, making them versatile acids.
4. The application of polyacid in agriculture has shown promising results in improving soil quality.
5. Scientists are exploring the use of polyacids in drug delivery systems for controlled release.
