

POLYMERIZATION

Meaning: Polymerization is the chemical process by which small molecules, known as monomers, combine to form larger, more complex structures called polymers, often used in the production of plastics.

1. Polymerization is a crucial process in the production of various plastics used in everyday items.
2. The scientist explained that polymerization can occur through different methods, including addition and condensation.
3. Understanding the mechanisms of polymerization is essential for developing new materials with desirable properties.
4. In the laboratory, we observed the polymerization reaction and noted the change in viscosity of the solution.
5. Advancements in polymerization techniques have led to the creation of stronger and more versatile synthetic fibers.
