

# PROPENE

*Meaning: Propene is a colorless, flammable gas that serves as an important raw material in the production of plastics and synthetic materials, particularly in the polymerization process to create polypropylene.*

1. Propene is a key building block in the production of various plastics and synthetic materials.
2. In the presence of a catalyst, propene can undergo polymerization to form polypropylene.
3. The chemical formula for propene is C<sub>3</sub>H<sub>6</sub>, indicating it is an unsaturated hydrocarbon.
4. Due to its reactivity, propene is often used in the manufacture of antifreeze and other chemical products.
5. Researchers are exploring sustainable methods for producing propene from renewable resources.
