

PTEROSTIGMA

Meaning: Pterostigma is a small, often colored spot located on the wings of dragonflies and other insects, which aids in flight stabilization and maneuverability.

1. The pterostigma of a dragonfly plays a crucial role in stabilizing its flight during aerial maneuvers.
2. Researchers have discovered that the size of the pterostigma can vary significantly among different species of dragonflies.
3. In certain species, the pterostigma is brightly colored, which may serve as a visual signal during mating rituals.
4. The pterostigma's unique structure is thought to contribute to enhanced lift and control while flying.
5. Observing the pterostigma can provide valuable insights into the evolutionary adaptations of various insect species.
