

REABSORPTION

Meaning: Reabsorption is the process by which substances, such as nutrients or water, are absorbed again by the body after being initially filtered out or excreted.

1. Reabsorption of nutrients in the intestines is crucial for maintaining overall health.
2. The kidneys play a vital role in the reabsorption of water and electrolytes.
3. During the process of reabsorption, the body retrieves essential substances from the filtrate.
4. Research has shown that impaired reabsorption can lead to various metabolic disorders.
5. In plant biology, reabsorption of water from the soil is essential for cell function.
