

REFRANGIBILITY

Meaning: Refrangibility is the property of a substance that determines how much it can bend or refract light of different wavelengths.

1. The refrangibility of light is a fundamental concept in optics that explains how different wavelengths bend at varying angles.
2. Understanding the refrangibility of materials is essential for designing effective lenses in photography and microscopy.
3. Scientists often measure the refrangibility of various substances to determine their optical properties and potential applications.
4. The phenomenon of refrangibility can be observed when light passes through a prism, creating a spectrum of colors.
5. In the field of physics, refrangibility plays a crucial role in the study of wave behavior as it interacts with different media.
