

REFRINGENCY

Meaning: Refringency is the property of a material that causes the separation of light into different colors as it passes through, influencing its optical behavior.

1. The refringency of the crystal was remarkable, causing vibrant colors to dance across its surface.
2. In the study of optics, refringency is a critical factor in understanding light behavior through different materials.
3. The scientist measured the refringency of the liquid to determine its potential applications in optical devices.
4. Due to its high refringency, the mineral was often sought after for use in jewelry and decorative items.
5. Understanding the refringency of various substances can lead to advancements in lens technology and imaging systems.
