

REPULLULATION

Meaning: Repullulation refers to the process by which a population of organisms, particularly insects, rebounds or increases in number after a decline, often due to favorable environmental conditions.

1. The study examines the phenomenon of repullulation in various species of insects.
2. After the initial population decline, repullulation occurs as the remaining individuals thrive in the new environment.
3. Scientists are fascinated by the mechanisms behind repullulation, as it demonstrates nature's resilience.
4. In agriculture, understanding repullulation can help farmers manage pest populations more effectively.
5. Repullulation is often observed in ecosystems recovering from disturbances, highlighting their ability to rebound.
