

RHEOTOME

Meaning: A rheotome is an instrument used to measure the flow properties and viscosity of fluids in fluid dynamics experiments.

1. The rheotome is an essential tool in fluid dynamics experiments.
2. Using a rheotome, the researchers precisely measured the viscosity of the fluid.
3. In the laboratory, the rheotome allowed for accurate slicing of the material under various flow conditions.
4. The design of the rheotome was crucial for obtaining reliable data in the study.
5. Engineers often rely on a rheotome to analyze the behavior of non-Newtonian fluids.
