

SALINATION

Meaning: Salination is the process of increasing the concentration of salts in soil or water, often leading to negative environmental and agricultural impacts.

1. Salination of the soil can lead to reduced agricultural productivity and biodiversity loss.
2. The coastal region is facing severe salination issues due to rising sea levels and increased evaporation.
3. Farmers are experimenting with salt-tolerant crops to combat the effects of salination in their fields.
4. Effective management practices are essential to mitigate the salination of freshwater sources in arid regions.
5. Research into salination patterns can help predict the long-term impacts of climate change on ecosystems.
