

SEDIMENTATION

Meaning: Sedimentation is the process by which particles settle out of a fluid, accumulating over time to form layers, often influencing geological and environmental changes.

1. Sedimentation plays a crucial role in shaping river deltas over time.
2. The study of sedimentation helps scientists understand past climate changes.
3. Excessive sedimentation can disrupt aquatic ecosystems by smothering habitats.
4. Engineers must consider sedimentation when designing reservoirs and dams.
5. Monitoring sedimentation rates is essential for managing water quality in lakes.
