SEISMOSCOPE

Meaning: A seismoscope is an instrument used to detect and measure vibrations or movements in the earth, particularly those caused by seismic activity.

1. The seismoscope detected the subtle vibrations of the earth, indicating a distant earthquake.
2. Ancient Chinese scientists developed the first seismoscope to measure seismic activity.
3. Modern seismoscopes utilize advanced technology to provide accurate readings of ground movement.
4. Researchers analyzed the data from the seismoscope to improve earthquake prediction methods.
5. The seismoscope's sensitive instruments allowed it to register even the faintest tremors.
