

SHADER

Meaning: A shader is a computer program used in graphics design and video game development to calculate the rendering effects on surfaces, enhancing visual appearance and effects.

1. The graphics designer created a stunning shader that transformed the appearance of the 3D model.
2. In video game development, a good shader can significantly enhance the visual effects of a scene.
3. The artist experimented with different shaders to achieve a more realistic water surface in the animation.
4. Shader programming requires a deep understanding of how light interacts with surfaces in a virtual environment.
5. Many modern engines allow developers to customize shaders for unique visual styles and effects.
