SILICATIZATION

Meaning: Silicatization is the geological process in which silica replaces other minerals in sedimentary rocks, altering their physical properties.

1. Silicatization occurs when silica replaces other minerals in sedimentary rocks.
2. The process of silicatization can significantly alter the physical properties of the rock.
3. Researchers studied the effects of silicatization on geothermal reservoirs.
4. In some cases, silicatization enhances the porosity and permeability of the rock formation.
5. Understanding silicatization is crucial for effective mineral exploration and extraction.
