

SONIFICATION

Meaning: Sonification is the process of converting data into sound to facilitate interpretation and convey information through auditory means.

1. Sonification allows data to be interpreted through sound, creating an auditory experience of information.
2. Artists are increasingly using sonification in their work to explore the emotional aspects of data.
3. In scientific research, sonification can reveal patterns in complex datasets that might not be visible through visual means.
4. The project aimed to enhance accessibility by integrating sonification techniques into the learning process for visually impaired students.
5. By transforming temperature changes into sound, the sonification process provided a unique way to understand climate patterns.
