

SPATANGUS

Meaning: Spatangus is a genus of echinoderms, commonly known as heart urchins, that inhabit sandy or muddy substrates on the ocean floor.

1. The spatangus is often found buried in sandy or muddy substrates along the ocean floor.
2. Marine biologists study the feeding habits of the spatangus to better understand its role in the ecosystem.
3. Spatangus species can vary greatly in color, ranging from pale yellow to deep purple.
4. During low tide, it is possible to spot a spatangus partially exposed as it awaits the return of the water.
5. The unique body shape of the spatangus allows it to maneuver easily through sediment.
