

SPECTROBOLOMETER

Meaning: A spectrobolometer is an instrument used to analyze the spectral properties and thermal emissions of materials.

1. The spectrobolometer is a crucial instrument for analyzing the spectral properties of materials.
2. Researchers utilized a state-of-the-art spectrobolometer to measure the thermal emissions from the sample.
3. In astrophysics, a spectrobolometer can provide insights into the temperature and composition of distant stars.
4. The team calibrated the spectrobolometer to ensure accurate readings during their experimental trials.
5. Innovations in spectrobolometer technology are paving the way for advancements in environmental monitoring and analysis.
