

SPECTROSCOPY

Meaning: Spectroscopy is the study of the interaction between matter and electromagnetic radiation to analyze the composition and properties of substances.

1. Spectroscopy is a powerful technique used to identify the composition of distant stars.
2. The chemist used infrared spectroscopy to analyze the molecular structure of the compound.
3. In biology, spectroscopy can help researchers understand the functions of various proteins.
4. The advancements in spectroscopy have revolutionized the field of material science.
5. By applying spectroscopy to environmental samples, scientists can detect pollutants in water sources.
