

STAUROLITE

Meaning: Staurolite is a brown or black silicate mineral that typically forms in metamorphic rocks and is characterized by its distinctive cross-shaped crystal formation.

1. Staurolite is often sought after by mineral collectors due to its unique crystal formation.
2. The presence of staurolite in the rock sample indicated a high grade of metamorphism.
3. Geologists often use staurolite as a marker mineral to determine the conditions of regional metamorphism.
4. In some cultures, staurolite is considered a good luck charm because of its distinctive cross shape.
5. The hardness and durability of staurolite make it a popular choice for decorative stone in jewelry.
