

SUBINDIVIDUAL

Meaning: Subindividual refers to variations or traits that exist within an individual organism, distinguishing them from broader species characteristics.

1. The concept of subindividual differences is crucial for understanding variations within a population.
2. Researchers are now focusing on subindividual traits that influence behavior beyond the general species characteristics.
3. In ecology, studying subindividual interactions can reveal insights about competition and cooperation among species.
4. The analysis of subindividual responses to stimuli can enhance our understanding of adaptive behaviors.
5. Subindividual variations in genetic expression may contribute to diverse phenotypic outcomes in organisms.
