

SUSCEPTOR

Meaning: A susceptor is a material or substance that enhances the efficiency of energy transfer or reaction processes in various scientific applications, particularly in biotechnology and experiments.

1. The susceptors used in the experiment were carefully chosen to enhance the reaction efficiency.
2. In biotechnology, a susceptor plays a crucial role in facilitating the transfer of energy during cell culture processes.
3. The innovative design of the susceptor allowed for more uniform heating in the microwave system.
4. Researchers discovered that the material of the susceptor significantly influenced the outcome of the deposition process.
5. Understanding the properties of the susceptor can lead to advancements in various fields, including materials science and electronics.
