

# TELEPOLARISCOPE

*Meaning: A telepolariscope is an optical instrument used to analyze the polarization of light in crystals and minerals, revealing detailed patterns and properties.*

1. The telepolariscope revealed intricate patterns in the crystal structure that were previously unseen.
2. Researchers used the telepolariscope to analyze the optical properties of various minerals.
3. By employing a telepolariscope, scientists were able to enhance their understanding of light behavior in complex materials.
4. The telepolariscope is an essential tool in the field of material science for studying anisotropic substances.
5. During the experiment, the telepolariscope provided crucial data that confirmed the theoretical predictions made by the team.
