

# TELETHERMOMETER

*Meaning: A telethermometer is an instrument used to measure temperature remotely, allowing for the monitoring of temperature changes from a distance.*

1. The telethermometer allowed scientists to remotely monitor temperature changes in the volcanic crater.
2. Using a telethermometer, the team was able to collect precise temperature readings from a distance.
3. The engineer explained how the telethermometer could improve safety measures in hazardous environments.
4. In the laboratory, researchers relied on a telethermometer to ensure accurate temperature control during experiments.
5. The telethermometer was essential for studying the thermal properties of materials under varying conditions.
