

THENARDITE

Meaning: Thenardite is a mineral composed of sodium sulfate (Na₂SO₄) that typically occurs in arid environments and saline deposits.

1. Thenardite is commonly found in arid regions where evaporation is high.
2. Geologists often study thenardite to better understand the mineral composition of saline lakes.
3. The chemical formula of thenardite is Na₂SO₄, indicating it is a sodium sulfate.
4. In some industrial processes, thenardite is used as a source of sodium for various applications.
5. Researchers recently discovered a new deposit of thenardite in a remote desert area.
