

THERMOSCOPE

Meaning: A thermoscope is an early instrument used to measure and demonstrate temperature changes and thermal expansion.

1. The scientist used a thermoscope to demonstrate the principles of thermal expansion.
2. In ancient times, a simple thermoscope was an important tool for understanding temperature variations.
3. Modern thermoscopes have evolved into sophisticated instruments that can measure minute temperature changes.
4. The thermoscope, though primitive by today's standards, laid the groundwork for the development of thermometers.
5. During the experiment, the thermoscope reacted to the heat of the nearby flame, providing immediate visual feedback.
