

THERMOTENSILE

Meaning: Thermotensile refers to the characteristics of a material related to its tensile strength and behavior when subjected to changes in temperature.

1. The thermotensile properties of the material were tested to determine its performance under varying temperatures.
2. Researchers are investigating the thermotensile behavior of polymers to improve their applications in aerospace engineering.
3. During the experiment, the thermotensile strength of the compound was found to be significantly enhanced by the additive.
4. Understanding thermotensile effects is crucial for developing materials that can withstand extreme thermal conditions.
5. The study revealed that the thermotensile response of the alloy is influenced by its microstructural changes.
