

TRANSUDATION

Meaning: Transudation is the process by which fluid, particularly plasma, passes through a membrane or capillary wall into surrounding tissues, often leading to fluid accumulation and swelling.

1. The process of transudation can lead to the accumulation of fluid in tissues, often resulting in swelling.
2. In certain medical conditions, transudation occurs when plasma leaks through the capillary walls into surrounding tissues.
3. The study focused on the role of transudation in the development of edema in patients with heart failure.
4. Transudation is distinct from exudation, which involves the release of more complex fluids and cells into tissues.
5. Understanding the mechanics of transudation is essential for diagnosing various health issues related to fluid balance in the body.
