

TRICHOPTER

Meaning: Trichopter refers to an insect belonging to the order Trichoptera, commonly known as caddisflies, whose larvae are aquatic and build protective cases from materials found in their environment.

1. The trichopter larvae are often found in freshwater environments, where they construct intricate cases from natural materials.
2. Entomologists study trichopters to understand their role in aquatic ecosystems and their sensitivity to pollution.
3. During my hike along the river, I spotted several trichopters fluttering above the water's surface, their delicate wings shimmering in the sunlight.
4. In the laboratory, researchers are examining the life cycle of trichopters to learn more about their development and habitat preferences.
5. The presence of diverse trichopter species in a stream can indicate a healthy ecosystem, making them valuable bioindicators.
