

TYMBAL

Meaning: Tymbal: a specialized, membranous structure in male cicadas that produces sound through rapid vibrations, used primarily for attracting mates.

1. The tymbal of the cicada produces a unique, resonant sound that can be heard from miles away.
2. During the mating season, the male cicada vibrates its tymbals to attract females.
3. Researchers studied the intricate structure of the tymbal to understand how it generates such loud calls.
4. The tymbal's design allows for rapid sound production, making it an effective tool for communication among insects.
5. In her biology class, she learned how the tymbal mechanism is crucial for the survival of cicadas in their natural habitat.
