

UNIVALVE

Meaning: Univalve refers to a type of mollusk that has a single, often spiraled shell, such as snails and limpets.

1. The univalve shell of the snail is often intricately patterned and beautifully colored.
2. In marine biology, univalve organisms such as conchs and limpets are studied for their unique adaptations.
3. The univalve structure of certain mollusks allows them to thrive in a variety of aquatic environments.
4. Unlike bivalves, univalve species possess a single, spiraled shell that houses their soft bodies.
5. The collector showcased a rare univalve specimen that captivated all the visitors at the exhibit.
