

UROCHORD

Meaning: Urochord refers to a marine invertebrate belonging to the subphylum Urochordata, characterized by a notochord present in their larval stage and often exhibiting a tunicate form in adulthood.

1. The urochord is a crucial part of the life cycle of many marine organisms.
2. Researchers study urochords to understand more about chordate evolution.
3. In its adult form, a urochord may resemble a jelly-like sac filled with water.
4. The urochord displays some unique characteristics that differentiate it from other chordates.
5. Scientists are investigating how urochords can contribute to our understanding of ecological systems.
